Investor due-diligence guide

Understand data-backed U, A and I instruments, valuation, legal issuer risks and the evidence needed before considering a real investment.

Edition 2.0 · 23 October 2026 · Educational/public explanatory documentation · No public investment offering or approval claimed

The three instruments are economically different

Class	What is purchased	What is NOT automatically purchased
U — commercial use	Defined contractual permission to use data, an algorithm or delivered service.	Shares, raw data title or profit participation.
A — transferable rights	Specified assignment, transferable IP rights or other expressly documented economic entitlements.	A security exemption or proof of ownership by hash.
I — investment securities	An actual security issued by a qualified legal issuer, with rights set by its terms.	A piece of raw data or guaranteed return.

How a single asset might support an issuer

Imagine a company whose principal business is licensing one robotics recovery dataset. Subject to incorporation, lawful rights, professional advice and securities requirements, that company could issue a class of shares. An investor’s claim would be on that issuer under its legal documents, not direct possession of the source dataset. An illustrative C$1 share price would not be a verified valuation or current offer. No proposed terms in these public pages should be taken as issued instruments.

Investment due-diligence checklist

Information needed	Why it matters	Present status
Legal issuer and control persons	Confirms who is accountable for disclosures and assets	Specific issued prospectus/OM and verified issuer financials not published
Full audited or appropriately prepared financial statements	Explains revenue, costs, related parties, liquidity and going concern	Not established for illustrative issuer
Actual instrument terms	Defines units, rights, voting, dilution, dividends, resale and priority	Sample economics only; no issued security evidenced
Title and permitted data use	Prevents investment predicated on restricted or disputed data	Rights review remains a required condition
Independent asset valuation / customer traction	Tests economic assumptions, alternatives and downside	Real verified asset market comparables not supplied
Regulatory distribution and venue permissions	A legal offering is not a license to run a trading venue	Live public securities venue not authorised in the documentation
Cash custody and settlement	Prevents synthetic wallet entries being mistaken for money	No verified live client-funds reconciliation supplied

Follow the money, not just the ticker

For any securities subscription, verify where investor funds actually go, the entity receiving them, escrow or custodian terms, whether securities are legally issued and what official register proves ownership. For commercial licensing, verify price, contract, delivery, invoice and bank reconciliation. These are separate ledgers and legal acts.

Understand the downside

- A dataset might be useful but never produce profitable customers.
- Asset value and share value are not interchangeable. Investors can lose all capital.

- A platform may have no lawful resale venue; liquidity can be zero.
- Rights can expire or be challenged; private information may be unusable even if technically available.
- Issuers may create additional shares or incur expenses and debts that dilute returns.
- Conflicts can arise among BTG, an issuer, source contributors, brokers and investors.

What the documentation cannot replace

Not a prospectus, offering memorandum, independent appraisal, current financial statement or legal eligibility decision. A sophisticated investor should require the specific issuer’s signed original offering documents, named professionals, actual audit scopes, contract rights and regulator or registration information before taking any action. No deposit instructions or investor enrolment are provided in this public library.
